Abstract (en)

[origin: EP0705925A2] A device for heating a running synthetic thread has a longitudinal slot (4) with parallel side walls (6, 7) as well as a longitudinal support (1) which along with thread guides (2, 3) are combined in one unit where the guides are formed to lead the thread in a zig-zag run in the slot and the unit is supported on the slot walls. Here, set in the slot base, the support is a solid good heat-conducting, pref. metal, block to which are attached the thread guides, i.e. pegs, which project into the slot.
