Abstract (en)

An outsole (1) for a sports shoe such as a tennis shoe consists of elastically deformable material and has sole profiling formed by recesses (2) in the ground-engaging side of the outsole. The bottom (8) of each recess (2) carries at least one projection (3) which projects towards the ground-engaging side of the outsole. Provided on the side of the bottom which is remote from the ground-engaging side of the outsole is a free space (12) into which the bottom can be displaced under loading, by virtue of elastic deformation of the part of the bottom which surrounds the projection in the respective recess. In the non-deformed condition of the bottom the projection does not project beyond the ground-engaging side of the outsole.
