Abstract (en)  
[origin: EP0706963A1] The driven transport rollers (12) are at right angles to the straight-edge (16). There are idling rollers (18a,18b) adjacent to the straight-edge. They can turn freely and may press against the peripheries of the driven rollers. The axes of the driven rollers are at right angles to the straight-edge, whereas those of the idling rollers are inclined to it. The pressures with which the idling rollers bear against the driven ones can be individually adjustable, or alternatively by groups, typically using a wire under tension (32) bearing against the roller spindles. The latter can be one pivoting cranked levers (24). The levers can be stirrup-shaped, with one arm pivoting at one side of the straight-edge and the other passing through an opening in the latter, with the roller turning on its free end.
