Abstract (en)

[origin: EP0707123A2] The bolt (3), as the result of a force release by the force accumulator (6), moves out into a frame-side closure plate. A force transmission, which can be coupled in and out, is provided between the force accumulator and the bolt, whereby the coupling (7) with the bolt moved outwards is uncoupled. The coupling, the force transmission device (10) and the force accumulator are arranged in the door. A second force accumulator (15) with a second force transmission component (48) as the result of force release draws back the bolt. The coupling is arranged between a drive rod driving the bolt and an operating rod (8) of the force accumulator.
