Abstract (en)

[origin: WO9501930A1] Prior art devices for transporting and depositing sheets in a delivery region of a rotary press conceal a considerable hazard for a machine operator in that grab bridges carried by rotating conveyor chains to carry sheets are moved over a sheet stacking region. Such a hazard is eliminated by the object of the invention in that the delivery region is divided into a sheet transport region with a chain conveyor system possibly comprising a drying station and a stacking region with a pneumatic conveyor system.
