Abstract (en)
[origin: WO9530796A1] The invention relates to a rail arrangement consisting of a rail, especially a grooved rail (2), an elastic rail base comprising a metal ribbed plate (15), a bed (17) and two intermediate layers (14, 16) of elastomeric material fitted between the rail foot and the ribbed plate or between the latter and the bed, two chambers on either side between the rail and the road surfacing (3), in which there is a filler section (4, 4') of elastomeric material in each chamber having, in particular, longitudinal grooves (6) and/or channels (5) and securing lips (7), and spaced rail clamps (12) on either side, which are in particular fitted with covers (13), in which, according to the invention, each filler section (4, 4') tapers in the region of the rail clamps (12) towards the rail foot forming a longitudinal groove (8) to accept the rail clamps (12) or covers (13), whereby a rail foot section (10) of elastomeric material is fitted in the groove between the rail clamps or covers. A further variant is proposed.
