Abstract (en)

[origin: EP0709329A2] The sheets are delivered by grips (03) at regular intervals along the top run (17) of a pair of endless chains (02) and with their most recently printed sides (34) downwards. After deflection so as to bring these sides uppermost, they are deposited on a first stack (23). Seen in their travel direction, the sheets can be deposited on one or more further stacks (24) as desired, using a single pair of chains common to all stacks. To deposit them on the second stack, the sheets are transferred from the grips of the top chain run to a further grip (27) after the first stack. This deflects them so as to bring the printed side uppermost to be deposited on the second stack.
