Abstract (en)
[origin: WO9531393A1] A system for group controlling a plurality of elevators in accordance with group control algorithm including a plurality of parameters. This system includes a means for searching an optimum set. An optimum set means an optimum combination among combinations of parameters to be given to the group control algorithm. A new set is generated by crossing-over or mutation. Superior sets are accumulated in a storage by utilizing the additional registration of excellent sets in a storage and the deletion poor sets therefrom. An optimum set is selected from these superior sets. Therefore, the searching of an optimum set can be done efficiently.
