Abstract (en)

[origin: EP0709530A1] The anchoring flange (14) of the oblong component is placed on a supporting slab, and has a profiled flange (22) extending upwards for the thickness of the plaster on the slab, also a second such flange (26) extending downwards to cover the slab end face. At the top edge of the upper flange (22) a profiled strip (32) is bent over rearwards above the concrete slab, its width being less than that of the anchoring flange. On this there can be a narrower strip section (34) extending downwards towards the slab. The outside surface of this strip section can slope towards the slab end face. The bottom flange (26) can also slope downwards from the anchoring flange, increasing the distance between it and the end face towards the bottom end.
