Abstract (en)  
[origin: WO9501715A1] A mower (1) comprises a pair of elongated mower units (9 and 10) which are pivotally connected about a vertical main pivot axis (15). The mower units (9 and 10) are pivotally carried on respective carrier arms (18 and 19) about vertical secondary pivot axes (20). The carrier arms are in turn pivotally carried on a mounting framework (16) which is mounted on a tractor (2). A pair of main rams (24) connected between the mower units (9 and 10) and suspension housings (80) which are rigidly carried on the respective carriers arms (18 and 19) pivot the mower units (9 and 10) about the secondary pivot axes (22) relative to the carrier arms (18 and 19) for pivoting the mower units (9 and 10) from an aligned operating position extending transversely of a centre line (8) of the mover (1) to a transporting position with the two mower units (9 and 10) side by side and parallel to the centre line (8).
