Abstract (en)

[origin: EP0710762A1] The flat elongated body (1) with solid, partially solid or hollow cross-section is in two parts, each fitting into a spacer piece. The two parts are locked in the spacer pieces by clamps in the form of a surface structure (2) corrugated in the longitudinal direction of the body. The corrugated surface structure consists of a tray-shaped recess extending on at least both sides of the middle (3) of the body towards the ends (4,5) as far as a trough (C). The recess rises from the trough towards the ends of the body, to form a peak (D) matching a peak in the middle of the body.
