Abstract (en)
[origin: EP0710879A1] The present invention concerns a radiographic product which makes it possible to obtain an image with no residual yellow colouring. The radiographic product comprises at least one photosensitive silver halide tabular grain emulsion spectrally sensitised with a spectral sensitising dye in the blue region having an emission peak between 400 and 500 nm, and an optical brightener derived from 4,4'-diaminostilbene disulphonic acid having at least three anionic sulpho groups, put in the photosensitive layer of the radiographic product or in at least one layer situated between the photosensitive layer and the support. Application to radiographic systems comprising an intensifying screen.
