Abstract (en)
[origin: WO9533087A1] The invention concerns a spinning device for the production of synthetic fibres, in particular regenerated-cellulose fibres, the device consisting of at least one feed pump (10, 20, 30), at least one feed line (11, 21, 31), at least one spinning nozzle (12, 22, 32) and a trough-like container used as the regenerating bath. Each of the feed lines can be pivoted about at least one joint (13, 23, 33). The device is characterized in that each joint is mounted so that it can move essentially horizontally and vertically. A special embodiment of the invention is characterized in that each joint is mounted so that it can pivot about a point of rotation (14, 24, 34). The device proposed enables the nozzles to be lifted easily out of a bath deep enough to give a long fibre-immersion distance.
