Abstract (en)
[origin: WO9533248A1] The IR intrusion detector proposed includes a transmitter (4), a receiver (5) and an evaluation circuit (2') with means (14 to 18) for producing a useful signal (Un). The evaluation circuit (2') includes a control unit (29) to which the useful signal (Un) is fed and which is connected to the receiver output, the control unit being designed to provide a compensation signal (Ik) superimposed on the receiver signal (Ie). The compensation signal is selected such that the useful signal (Un) is stabilized at zero in order to maintain the sensitivity at its maximum level. In a preferred embodiment of the invention, an analogue/digital converter (26, 30) is connected in series with the control unit (29), the converter digitizing the control signal and being connected to a digital/analogue converter (25, 32) designed to generate a voltage corresponding to the value of the digital signal. This voltage determines the compensation signal (Ik).
