Abstract (en)  
The refrigerator door includes a circumscribing seal (9), with an outside portion that may be tube-shaped(5) to house a magnet inside it. The seal (9) has another inside portion or section (4) that carries out the hermetic sealing of the insulating material injected between the door (8) and the inner covering (7) of the refrigerator. The outside portion of the seal (9) is separable when it becomes worn, it being replaced by a substitute seal (11) that essentially has the same shape as the removed portion, and includes a means of fastening to the support surface (13) of the inner covering (7), defined by a flat adhesive strip provided with a withdrawable protection film. <IMAGE>
