Abstract (en)

[origin: EP0713947A1] The mechanism is for the selective drive of a window, door etc. It has an actuating shaft (10) extending through an opening (22) in a leaf-frame and engaging with a driving member (2). This extends through a guide bush (13) secured in the opening. It has a rotary driving stop (12) at the end towards the member. The stop protrudes in the radial direction beyond the internal surface of the bush in the radial direction. On the external surface of the bush there can be a radial locking protrusion preventing rotation, and by which the bush is supported from the internal surface of the opening. There can also be an axial stop (21) on the bush, protruding in the radial direction. It has a pointed locking pin protruding towards the frame.
