Abstract (en)

[origin: EP0713948A1] The damping device comprises a stator (11) with a central pivot (13) that is flexible in a radial direction for the snap-on connection of a rotor (12) provided with a hole (14) for accommodating the pivot. The stator (11) is cup-shaped so as to internally accommodate part of the rotor (12) and comprises a single cylindrical ridge (17) that separates two annular chambers, respectively an inner one (18) and an outer one (19), which accommodate, with an appropriate clearance, corresponding inner and outer cylindrical portions (20, 21) of the rotor. The inner portion (20) is discontinuous and formed by spaced sectors. Grease is interposed in the annular spaces between the rotor and the stator and in the spaces that separate the sectors of the inner cylindrical portion (20) of the rotor, the grease having a slowing function. External grease seepage is prevented by a flexible edge lip (22) of the outer cylindrical portion (21) of the stator (12). <IMAGE>
