Abstract (en)

[origin: WO9501900A1] A device is disclosed for releasing the opening of the doors of rail vehicles. One or several successive punctual transmission devices (ZUB1 to ZUB4) arranged at the entry of a station (station) transmit synchronisation signals to distance measuring devices arranged in the passing trains (Z1, Z2). A distance measuring device (3) is directly influenced and the other (6) is influenced through an automatic train protection device on the train. The doors may be opened when the train has stopped, when the directly influenced distance measuring device (3) shows that the announced stop (P1, P2) has been reached with a narrow tolerance value (T1) and when the other distance measuring device (6), which has a larger tolerance range (T2), confirms said position.
