Abstract (en)

[origin: WO9506321A1] Materials based on silver/iron oxide have been proposed as substitutes for the silver/nickel materials frequently used for contact pieces in low-tension switchgear in particular. The invention proposes a material containing an additional active component consisting of an oxide of a metal of the third sub-group in the periodic table, particularly yttrium oxide (Y₂O₃). A material of the composition Ag/Fe₂O₃10/Y₂O₃1, for instance, which has suitable temperature behaviour, has the spectrum of properties required for contact pieces. In addition, the material may also include at least one metal oxide containing elements of the sixth sub-group of the periodic table, preferably iron tungstate (FeWO₄). The material of the composition Ag/Fe₂O₃9/Y₂O₃1/FeWO₄0.5 has proved to be particularly suitable on account of its further improved welding and short-circuit characteristics.
