Abstract (en)

The invention relates to and provides a door (3), for instance a garage door, which has the feature that it comprises at least two panels (6-8) lying one above the other, namely a first panel (7) and a second panel (6); that on each side of the second panel (6) a member support (9) is arranged which carries an endless member (10), and that the first panel (7) is coupled to the endless member (10). The door hereby occupies little space in the opened position. Because the panels lie one above the other in their stowed position, a door does not have to extend inward over a great length from the door opening into the area to be closed off, for example the garage. <IMAGE>
