Abstract (en)

[origin: WO9507533A1] A device for receiving and transporting objects with a through hole consists of a base frame and of a container body in two parts (7, 8) that may be interconnected. One of the front openings fits over the rear of the other part of the container, so that its volume is reduced and it may be stored. A special transport pallet is designed to receive four such devices with or without their content.
