Abstract (en)
[origin: EP0718471A1] The shield (9) to protect a turbine housing from broken blades, consists of a ring of a ductile material around the turbine stator (2), attached to the engine by fixings which are calculated to shear below the force needed to break the shield. This allows the shield to deform with the annular space between the stator and outer housing (3), containing the broken blade(s) within the housing. The fixings can be in the form of shearing bolts, pins or lugs connecting the shield to the engine, or a zone of reduced strength with initial perforations.
