Abstract (en)

[origin: EP0718726A2] The timer clock has an analogue display driven by an electric motor, providing the actual time, the cooking duration and the cooking start time, selected via function selection switches, with operating switches for setting the cooking time and the start time and switching relays for controlling the operation of the oven. The selection switches and the operating switches may be provided by a single multi-function switch (5). An electronic memory is used for storing at least the cooking time, with an electronic control controlling the setting of the analogue displays for the cooking time and the start time.
