Abstract (en)

[origin: WO9508496A1] A flexible and substantially non-resilient package (1) containing a number of three-dimensional objects (50). The package is such that multiple packages are stacked on top of one another. The package includes a flexible substantially rectangular container (2) comprising opposing top and bottom walls (10, 11) and two pairs of opposing side walls (12, 13, 14, 15), all of which are joined together to form an interior chamber (3) for containing the non-rectangular objects. The three-dimensional objects to be contained, such as soap bars, are substantially rigid and non-rectangular. The objects have two non-planar opposing oblong faces (51, 52). The faces are connected by a pair of opposing major peripheral edges (53, 54) and a pair of opposing minor peripheral edges (55, 56) with the minor peripheral edges being smaller than the major peripheral edges. The objects are placed within the container in face to face relation with the major and minor peripheral edges of each object being parallel. The objects are constrained within the package so that movement of the objects with respect to one another and with respect to the container is substantially limited. Thereafter, multiple packages can be stacked on top of one another with the objects resting on their minor peripheral edges and the load of the objects can be transmitted through columns of stacked objects.
