Abstract (en)

[origin: EP0719705A1] A method and a device for enveloping, at least partially so, an object in a envelope comprising a sheet, whereby the object to be enveloped is transported in a conveyor to a sheet extending transversely to the direction of transport, after which the sheet is carried along by the moving object and folded round the object about a folding line extending transversely to the direction of transport, whereby a first end part of the sheet extends beyond a rear part, seen in the direction of transport, of the object. The sheet-enveloped object is then deflected in a first direction of deflection including an acute angle with the direction of transport and extending transversely to the folding line, and the enveloped object is then moved in a direction opposed to said first direction of deflection, after which the enveloped object is deflected in a second direction of deflection extending transversely to the folding line, whereby the first end part of the sheet is folded round the rear part of the object, seen in the direction of transport, and round the front part of the object, seen in the second direction of deflection, and attached to a second end part of the sheet folded round the object.
