Abstract (en)
[origin: EP0721028A2] The flexible hoses (15-26) form layers one above the other when filled with a medium, the joins between them running in their lengthwise direction. The axes of the hoses are offset when seen in cross-section. The components (30-43) joining the hoses together extend past those in each layer. The weir can be permanently installed where it will be needed, the hoses in the bottom layer being fixed directly to the ground. In the unfilled state, the weir can be enclosed by a cover (13) comprising a one-piece steel plate extending for the full hose length, hoses in the topmost and other layers being secured to it.
