Abstract (en)

[origin: WO9508812A1] The present invention is an apparatus and method for determining the earliest possible time that a living creature reaches its maximum rate of growth. This information is then used to calculate the optimal parameters for achieving the maximum return on investment. A computer (figure 4) determines the optimal number of birds for a flock, type and amount of feed, length of time between hatching and sale to food processor, etc. The computer (figure 4) consists of a microprocessor (20), random access memory (30), a storage device (32), a keyboard (24), a computer screen (26), a printer (28), and a math co-processor (22).
