Abstract (en)

[origin: EP0722013A1] The track maintenance system measures the actual position of the rail track (5) at a defined point (69), upstream of the maintenance point (68), relative to a spaced reference position (20), with the measured value being stored, for comparison with a subsequently measured value for the same point, obtained after working on the track. The track maintenance device (7) is maintained in operation as long as the compared position values are the same. Pref. the reference position for the actual track position measurement is provided by an adjacent rail track to that being worked on.
