Abstract (en)

[origin: EP0722788A1] A process and assembly separate a mixture (2) of two different materials (2a, 2b) into their components, one of which has a lesser fluid esp. air resistance than the other. The mixture (2) is introduced into a first flow of fluid (D) in which one component (2a) is spatially separated from the second (2b). The first component (2a) with the lesser fluid resistance is then transported in a second fluid flow (S) to a receiving station. The novelty is that, the first fluid flow (D) is weakened after it has passed through the original mixture (2), in that it at least partially dissipates before reaching the second fluid flow (S).
