Abstract (en)  
[origin: EP0722830A2] The application roller (2) can be adjusted w.r.t. the formed cylinder (1), while an intermediate roller (3) contacts the application and an immersion roller (4). The intermediate and immersion rollers can be moved away from the application roller and from each other, with thin contact positions reproducible. All rollers are adjustable. The application roller is directly mounted in a bearing shield (5) in the machine frame, while the other rollers are thus mounted via an intermediate location of their adjusting members. The bearing shield is swivelable in the forme cylinder direction.
