Abstract (en)

[origin: EP0723927A1] A locking element (17) below the hook (12) grips under the hook at least in the hole (9) in the reinforcement piece (7). The suspension (1) has a holder bracket (10) joined to a support (11). Above the hook the support has at least one protuberance (18) insertable into a flange (5) in an edge piece, when the hooked protuberance (14) at least partly grips behind the top edge (15) of the hole in the reinforcement piece. In this position, the inwardly displaced locking element grips under the hook.
