Abstract (en)

[origin: WO9511189A1] The present invention proposes a solution to the problem caused by the nonalignment, with respect to a horizontal plane, of the support platforms (1, 2) in an electrohydraulic lifting device equipped with two support platforms. The nonalignment occurs in the raising and lowering stages and the invention allows for controlling continuously the height of the support platforms (1, 2) and for promptly carrying out the necessary adjustment to set again the support platforms (1, 2) in alignment with each other.
