Abstract (en)

[origin: WO9512564A1] A process for producing CCl₂FCF₃ substantially free of CC₁F₂CC₁F₂ is disclosed. The process includes contacting a feed mixture consisting essentially of C₂Cl₃F₃ where the ratio of CCl₂FCClF₂ to CCl₃CF₃ is at least about 1:9 with an isomerization catalyst to produce an isomerization product wherein there is less than about 50,000 parts by weight CCl₂FCClF₂ per million parts CCl₃CF₃. The isomerization product is contacted with HF in the vapor phase in the presence of a fluorination catalyst comprising trivalent chromium at an elevated temperature below 400 DEG C selected to provide a fluorination product containing C₂Cl₂F₄ and C₂Cl₃F₃ wherein there is less than 10,000 parts by weight CCl₂FCClF₂ per million parts CCl₂FCF₃ and wherein the parts by weight CCl₂FCClF₂ per million parts CCl₃CF₃ is greater than the parts by weight CC₁Cl₂FCC₁F₂ per million parts CCl₃CF₃ in the isomerization product. The C₂Cl₂F₄ from the fluorination product is recovered; and C₂Cl₃F₃ from the fluorination product is recycled to the isomerization step along with an additional amount of CCl₂FCClF₂ which is at least equal to the amount of C₂Cl₂F₄ recovered from the fluorination product and is sufficient to provide the desired feed mixture ratio of CCl₂FCClF₂ to CCl₃CF₃.
