Abstract (en)

[origin: EP0725181A1] A washing machine is described, comprising all the known elements for its functioning, from among which an electronic control system and manual command means (3;3A), said washing machine (1;1A) being able to carry out, in function of information obtained by way of said command means (3;3A), at least one predetermined treating cycle from among a plurality of different possible treating cycles, whether they are predetermined or not, the carrying out of said treating cycles depends upon numerous parameters relative to characteristics of the products to be washed. According to the invention, said control system comprises an electronic programmer to which memory means and sensor means are associated arranged within the machine, and for the selection of a treating cycle predetermined and stored in said memory means, said programmer has the necessity of a single information, inputted by the user by way of said manual command means (3;3A), relative to a characteristic parameter of the products to be washed, the other parameters that determine said treating cycle being obtained in an automatic way by the programmer, by way of coded data in said memory means and/or by way of said sensor means. <IMAGE>
