Abstract (en)

[origin: EP0725500A2] The receiver (2) passes signals from its antenna (1) to an RDS decoder (3). It is tuned (6) by a microprocessor (5) which also controls an audio amplifier (7) driving a loudspeaker (8). The traffic message channel computer (11) selects messages from the decoder in accordance with criteria entered from a control panel (4) via an interface (12). The selected messages are stored in nonvolatile random-access memory (13) and decoded (15) for reprodn. through a speech synthesizer (14). Lists of placenames and events are stored in read-only memories (16, 17).
