Abstract (en)

[origin: EP0725502A2] The receiver (2) passes signals from its antenna (1) to an RDS decoder (3). Decoding and reprodn. of messages are controlled by a microprocessor (11) with memory (12) for event-related and speech-relevant data and algorithms. A chip card (15) is read via an interface (13) and synthesized speech signals undergo digital-analogue conversion (17) for an audio amplifier (4) driving a loudspeaker (5). Other information such as the type of message selection is displayed (18).
