Abstract (en)  
[origin: WO9511701A1] Disclosed is a method of inhibiting the entry of HIV into the vaginal and rectal mucosal epithelium by administering a peptide vaccine. Antibodies generated against peptides corresponding to epitopes of gp120 involved in entry into mucosal cells are generated in vivo by introduction of peptides or peptide-cholera toxin conjugates into epithelial cells. The resulting neutralizing antibodies are able to block subsequent infection of these tissues by HIV.
