Abstract (en)

[origin: EP0727850A2] The apparatus fixes a component in a housing, esp. a plug part, coupling part, sensor etc. in a through opening of a chassis wall or a machine element. The apparatus has a sleeve. The shape and size of the outer cross-section contour of the sleeve correspond to the cross-section contour of the through-opening (29). The sleeve has at least one tongue formed by a substantially axially parallel cut. The tongue has at its free end a radial hook-type collar (6). A radial shoulder (7) is provided at the distal side of the collar (6). A locking member (11) is mounted on or in the shoulder (7). The locking member (11) co-operates in a form fitting manner with the housing of the component (20) received in the sleeve. The component housing or a section of it lies on the tongue with the collar (6).
