Abstract (en)

[origin: EP0728543A1] There are two parallel transporting rails (2) which can be moved horizontally and vertically by motors (12, 13). Each rail is linked to a coupling rod (14) for a horizontal motion. Traverses (7) are each in working engagement with at least one rail by means of at least one of the coupling rods. The traverses can be moved by an auxiliary transverse drive (9). This is driven synchronously with the drive motors for the horizontal movement of the rails towards each other. These drive motors are in a lock casing in the press. The transverse drive may have a torque transmission device (11) to move the traverses.
