Abstract (en)

[origin: EP0728544A1] The transfer device has two horizontal spaced-out transporting rails (2) which can be moved horizontally and vertically towards each other by motors. The motors are on a traverse (7) and link the rails to the traverse. A levelling guide (10) is fitted between the transporting rails and the motors for the horizontal movement of them. This guide has at least two braces (11, 12) and a twin-arm tie (13) with three connecting points (15-19). Each brace is linked to one point on the traverse side. The other end of the brace is connected to the connection point (18, 19) of the twin-arm tie. Its third point is pivoted to the rail.
