Abstract (en)  
[origin: EP0728876A1] The assembly consists of cruciform main supports (1,2), each having at least one end which can engage with the end of another support, joists (6) with ends shaped to engage with the supports, and rafters (11) which have one end shaped to engage with a support and the other with another rafter and a support. The interior walls of the building are made from panels shaped to engage with the supports, and the outer ones from other panels with inner surface couplings shaped to engage with hooks fixed to the supports. One end of each support has a central recess or projection for engaging with another support, and the rafters are designed to take ceiling panels and insulation material. The exterior wall coupling elements can be in the form of steel rods fitted between battens and designed to engage with the support hooks.
