Abstract (en)

[origin: EP0729143A2] Light is emitted from a light-emitting element toward an irradiated medium, and returning light reflected by the irradiated medium is diffracted by a hologram device. A polarizer polarizes the light diffracted by the hologram device to produce first polarized light that has passed through the polarizer and second polarized light that has been reflected by the polarizer. The first polarized light is detected by a first light-detecting element, and the second polarized light is detected by a second light-detecting element. A magneto-optical signal is generated as the difference between the intensities of the first and second polarized lights which are detected respectively by the first and second light-detecting elements. <IMAGE>
