Abstract (en)
[origin: WO9513717A1] To improve shock absorption and resiliency in a shoe sole, especially for athletic shoes with at least one sole section (15, 16, 50), while maintaining as little sole thickness as possible, and to be able to regulate flexural elasticity and, independently thereof, elasticity in the vertical direction, while maintaining a low sole weight, the invention proposes that the sole section (15, 16, 50) have channel-like recesses that run parallel to one another, at least in sub-sections, in top and bottom surfaces, with those situated on one side of the sole section (15, 16, 50) being staggered from those situated on the other side.
