Abstract (en)
[origin: EP0729770A2] The bolt lever (4) has a handle (5) and in the lock position is protectively accommodated together with the handle completely between two housing-side two vertical side walls (8) extending in the ski longitudinal direction. The bolt lever carries a marking (11), which works in conjunction with a housing-side counter marking for indication of a thrust lift occurring when a ski boot is placed in the binding. Where a thrust lift occurs, the housing (3) moves against the force of the thrust springing effect relatively to the locked lever. The counter markings are formed on the side walls. The markings and/or the counter markings are visible from above.
