Abstract (en)
[origin: EP0730080A1] The fixing, for a roller blind shaft (1) which has one end (2) able to rotate on a section of a telescopic axle (7), consists of a coupling (15) in the form of a bush (16) projecting from a fixed side plate, retainers (19, 29) on the axle and bush, and a spring clip (27) to hold them together. The retainers on the axle are in the form of two tongues (21) which extend radially from its outer surface diametrically opposite one another and fit into slots (24) in the bush (16). The bush has retainers in the form of radial projections which are located adjacent to the two tongues when the axle is inserted into the bush, and the spring clip fits between the two sets of projections to hold them together.
