Abstract (en)

[origin: EP0730087A1] To mount a vibration isolating member easily at low costs, mounting holes 20 are formed through a platelike vibration isolating member 10, and projections 17 integrally projecting from a shroud 9 are forced into the mounting holes 20, thereby temporarily mounting the vibration isolating member 10 on the shroud 9. In this condition, the shroud 9 is mounted to the cylinder head 8, thereby holding the vibration isolating member 10 between the inner surface of the shroud 9 and fins 22 of the cylinder head 8. Many similar vibration isolating members 10 can be continuously formed by punching a belt-shaped stock. <IMAGE>
