Abstract (en)

[origin: EP0730850A1] The halo, consists of at least two frontal-temporal bars (1) which are joined together and designed to fix the position of the patient's forehead and temples, and two semi-arcs (2) which are joined together to fix the position of the rear upper portion of the cranium and are attached to the frontal-temporal bars. Both the frontal-temporal bars and the two semi-arcs are joined together by short bars (4,5) which overlap their adjacent ends, all of the components having holes (9,10) or slots (7,8) for fixing screws (6), with the slots permitting relative adjustment of the components. In a variant of the design the frontal-temporal bars and rear semi-arcs can be joined together directly by having shaped overlapping ends.
