Abstract (en)  
[origin: EP0731229A2] The holder is for a hand-held shower head, having a slotted sleeve (5) tapering on the inside and in which the mating tapering portion on the head is inserted in the axial direction. If desired, the sleeve can slew in the holder on an axis at right angles to that of the tapering portion. The elastomer layer (19) is situated between two parts movable in relation to each other, and lies flat against one of them at least, being effective at least during relative movement between them. The tapering face of the sleeve can be coated with elastomer, part (8) of the holder (4) bearing against it during the pivoting movement. At the outside of the sleeve the elastomer portion can be annular (20), the wall-holder bearing against it in the radial direction.
