Abstract (en)

[origin: EP0731580A1] The method involves connecting a number of users (U1-Un) via a network to a number of application servers (A1-Am) and a kiosk (K). To ensure that the server cannot identify the user and the kiosk cannot identify any links between users, the server sends a request for payment which the user passes to the kiosk. The user's account is debited and an "electronic cheque" dated with a blind signature and random number is sent to the user, who forwards it to the server. The server verifies and stores the "cheque" for later transmission to the kiosk, which periodically remits cumulative payment for all verified "cheques".
