Abstract (en)

[origin: EP0731620A2] The invention relates to mobile telecommunication networks. In such networks mobile handover can lead to the connections in the fixed network infrastructure being non optimal, resulting in the wasteful use of network resources. However optimisation of the network can cause breaks in transmission with the consequent corruption of user data. The mobile telecommunication network makes use of asynchronous transfer mode transmission and switching and incorporates broadband switching nodes. The facilities incorporated into such broadband switching nodes are used to enable network optimisation without the corruption of user data. To achieve various network configurations between the broadband switching node and mobile network interface units, marker cells are inserted into the data stream. Marker cells detectors are provided and the switching configurations are carried out in accordance with the detected marker cells. <IMAGE>
